# EXPANDING SUSTAINABLE APPROACHES FOR PREMIUM PORK

Pork accounts for around 75% of Vietnam's domestic meat consumption and is valued at around AUD 5.6 billion.

The pork industry relies on small-scale producers across the country who need to balance farm productivity, environmental sustainability, food quality and safety.

Recent external shocks (including COVID-19 and African Swine Fever) have created market opportunities for sustainable and local pork products.

A circular economy approach for organic pig farming recycles waste into household biogas, water for crops and earthworms for soil health and pig feed.

This sustainable approach reduces risks and offers a high value product for a growing domestic market.

- New premium local product to meet high end demand
- Reduced environmental waste and improved soil condition
- Increased industry resilience to external shocks
